

Decomposing the numbers

Decomposing the Numbers

- Decomposing a number is the process of breaking it down into smaller parts.
- In place value, it involves breaking the number down into its individual digits and representing each digit by its place value.

For example,

There are totally **15** balls are there.

In that 15 balls, there are

10 greens balls 

5 orange balls. 

$$15 = 10 + 5$$

So, **15** is breaking into smaller parts that are **10** and **5**

15 is decomposed as **10** and **5**

Example:

Consider the number 14.

It has two digits **1** and **4**.

The digit **1** is in the **tens** place and the digit **4** is in the **ones** place.

That means 14 has **1** ten and **4** ones.

We can write 14 as

$$14 = 10 + 4$$

So 14 can be decomposed as $10 + 4$

Tens Ones

1

4

Decompose the numbers in the number bond

Example 1:

2 tens and 5 ones makes 25

20 and 5 makes 25

$$20 + 5 = 25$$

Example 2:

7 tens and 6 ones makes 76

70 and 6 makes 76

$$70 + 6 = 76$$

Decomposing a number using the addends method

In this method, we separate or break down a number into different addends

For example,

Consider the number 8.

To decompose the number 8 into its addends you have to think about how you can create this number using smaller numbers.

$$8 = 0 + 8$$

$$8 = 1 + 7$$

$$8 = 2 + 6$$

$$8 = 3 + 5$$

$$8 = 4 + 4$$

Decomposing the Numbers using number bonds

These are different ways to decompose the number 8.

Let us decompose the number 47

40

7

30

17

30

10

7

20

20

7

10

10

10

10

7

Example 1: Decompose the number 15

10

5

15 can be decomposed as 10 and 5.

10 and 5 gives 15.

$$15 = 10 + 5$$

Example 2: Decompose the number 29

10

10

29 can be decomposed as 20 and 9

20 and 9 gives 29

$$20 + 9 = 29$$

9

Example 3: Decompose the number 48

48 can be decomposed as 40 and 8

40 and 8 gives 48

$$40 + 8 = 48$$
