# FINDING THE PLACE VALUE 

To identify the tens and ones in the two digit number,
$>$ Look at the two digit number.
$>$ From right, the first number is in the ones place.
$>$ From right, the second number is in the tens place.
After that, you can say how many ones and tens in a two digit number.

```
1st from right - Ones
2nd from right - Tens
```

## Example:

Find the tens and ones in 19.
19 is a two digit number.
From right, the first number is 9 . So, 9 is in the ones place.
From right, the second number is 1 . $\mathrm{So}, 1$ is in the tens place.

```
Ones place - 9 ones are here ( \({ }^{\text {st }}\) from right)
Tens place -1 ten is here ( \(2^{\text {nd }}\) from right)
```

In 19, there are 1 ten and 9 ones.

## Example:

Find the tens and ones in 72.
72 is a two digit number.

From right, the first number is 2. So, 2 is in the ones place.
From right, the second number is $7 . \mathrm{So}, 7$ is in the tens place.
In 72, there are 7 tens and 2 ones.

## Example:

Find the tens and ones in 47.
47 is a two digit number.
From right, the first number is $7.50,7$ is in the ones place.
From right, the second number is 4 . So, 4 is in the tens place.

In 47 , there are 4 tens and 7 ones.

## Example:

Find the tens and ones in 50.
50 is a two digit number.

From right, the first number is 0. So, 0 is in the ones place.
From right, the second number is 5 . So, 5 is in the tens place.
In 50, there are 5 tens and 0 one.

Example:
Count the donuts and find how many tens and ones.

##  <br> 

## Answer

There are 22 donuts.
22 is a two digit number.

In 22, there are 2 tens and 2 ones.

Example:
Count the balls and find how many tens and ones.
00000000000000000000 000000000000000000000

## Answer

There are 41 balls.
41 is a two digit number.

In 41 , there are 4 tens and 1 one.
